

Structures in C

By: Yehia M. Abu Eita

Outlines

- Introduction
- Creating new structure type
- Declaring a structure variable
- Structure variables in memory
- Accessing a structure variable members

Introduction

- Structure is a **non-primitive** data type that stores **different types of data**.
- Structures are used to **group different types of data together**.
- You have to **create** the **new structure** type **first**, and **then** you can **declare** structure variables.
- Structure **size differs** according to the **sizes of its members**.
- Using structures will enhance your code organization.

Creating new structure type

- A creation of the new structure data type must occur first, **written first in the .c file**, before any declaration occurs.
- **Creation** of a data type **doesn't mean** that we **allocate** anything from the **memory**.
- **Creation is just informing the compiler.**

```
struct student
{
    unsigned char name[16];
    unsigned int id;
};
```

Declaring a structure variable

- After creating a new structure data type, you can declare a variable.
- Declaration Example:
 - `struct student student1_data;`
- Also you can set initial values for the structure variable members.
- Definition Example:
 - `struct student student1_data = {"Ahmed", 200};`

Structure variables in memory

20 Bytes

- Defining a structure variable:
 - `struct student student1_data = {"Ahmed", 200};`
- The size of this variable into the memory is **20 bytes**.
 - **16 bytes for the array of characters "name".**
 - **And 4 bytes for the integer member "id".**

```
struct student
{
    unsigned char name[16];
    unsigned int id;
};
```

0	'A'
1	'h'
2	'm'
3	'e'
4	'd'
5	'\0'
6	'\0'
7	'\0'
8	'\0'
9	'\0'
10	'\0'
11	'\0'
12	'\0'
13	'\0'
14	'\0'
15	'\0'
16	0xC8
17	0
18	0
19	0
20	

Accessing a structure variable members

- Use the **'.'** **operator** to access the structure members.
- Access structure members is for reading and writing.
- Examples:

```
- struct student x = {"Ahmed", 200};  
- x.name[1] = 'H';  
- x.id = 1000;    // 0x03E8
```

```
struct student  
{  
    unsigned char name[16];  
    unsigned int id;  
};
```

0	x.name[0] = 'A'
1	x.name[1] = 'H'
2	x.name[2] = 'm'
3	x.name[3] = 'e'
4	x.name[4] = 'd'
5	x.name[5] = '\0'
6	x.name[6] = '\0'
7	x.name[7] = '\0'
8	x.name[8] = '\0'
9	x.name[9] = '\0'
10	x.name[10] = '\0'
11	x.name[11] = '\0'
12	x.name[12] = '\0'
13	x.name[13] = '\0'
14	x.name[14] = '\0'
15	x.name[15] = '\0'
16	x.id = 0xE8
17	x.id = 0x03
18	x.id = 0
19	x.id = 0
20	

Summary

- Now you are familiar with structures in C.
- You can create, declare and manipulate structures.
- You have learned that structure size depends on its members' sizes
- Accessing structures using the '.' operator.
- Remember that initial values given to structure members must be in the same order of the members created into the structure.
