Giza governorate, Egypt

Dear embedded systems engineers,

I am very optimistic about getting a job as a junior embedded system software engineer in your team, I am looking forward to learning a lot from you and being something in your big team, I am obsessed with everything related to hardware. I have a good will to complete my projects and help my colleagues with anything and am almost free to work. This job is my passion, it's more like to be a hobby than just a job.

During the last 2 years, I have enrolled in many courses like AMIT, EGFWD, and Fastbit on Udemy and learned a lot of things and completed so many projects, I have made a toy car using only cheap MCU and 4 motors with one controller and this car can be controlled using a mobile phone, I have also developed my own drivers for MCUs and made a project with them like fire detectors and smart doors, I have made a server on Arduino that run and accept any requests that want some information like temperature, etc...

I am very willing to learn new technologies. currently, I am learning how to develop my RTOS to develop my own FREERTOS version to make my projects very time specific, I am also willing to take the advanced embedded systems course with EGFWD to improve my practice and gain more knowledge.

I hope to be a part of your team and add some good value to this team, I am very willing to be a good worker and never let down my team. I would look to have a detailed interview to talk more about my experiences and why should I be qualified for this job and what values I will add to the team. So if you are willing to know more about me, please contact me. Thank you for your time, really appreciate that you made it till this point.

Best regards,

Abdo salm.
